

7. loc() method with Boolean indexing

`df.loc[...]` method also can be used with Boolean indexing for more explicit row and column selection.

```
3  data = {  
4      'A': [1, 2, 3, 4, 5],  
5      'B': [10, 20, 30, 40, 50]  
6  }  
7  
8  df = pd.DataFrame(data)  
9  filtered_df = df.loc[df['A'] > 3]  
10 print(filtered_df)
```
